Abstract

Teaching Learning Based Optimization method is an evolutionary algorithm that simulates the teaching–learning phenomenon of a classroom. This MATLAB code implements this technique for truss optimization problem. HelpTLBO.mp4 explains how to use the code. More details about TLBO method and more efficient TLBO algorithm could be found in the following references: 1- Multi-class teaching–learning-based optimization for truss design with frequency constraints 2-Design of space trusses using modified teaching learning-based optimization

Optimal Mass Design of 25 Bars Truss with Loading Conditions on Five Node Elements

February 2019 · International Journal of Mathematical Engineering and Management Sciences

Koumbe Mbock · Etoua Remy Magloire · Lezin Seba Minsili · Richard Okpwe Mbarga

The optimal design of a twenty-five bar space truss commonly involves multiple loading conditions acting on 4 node elements in the linear elastic model. In this paper, we describe the behavior of the truss system with our experimental loading conditions on five node elements subject to minimum displacement and stresses that are used to formulate the constrained nonlinear optimization problem. ... Binary Locally Repairable Codes With Minimum Distance at Least Six Based on Partial t -Spreads

April 2017 · IEEE Communications Letters

Mi-Young Nam · Hong-Yeop Song

We propose a new construction for binary locally repairable codes (LRC) based on a (partial) t-spread, which constructs an LRC with minimum distance d 6 and any locality r 2. Furthermore, we found that there are some cases in which the resulting codes are optimum in terms of the upper bound by Cadambe and Mazumdar in 2015.

Comparison of Exact and Approximate Discrete Adjoint for Aerodynamic Shape Optimization

January 2009

Giampietro Carpentieri · Michael Van tooren · Barry Koren

The effect of approximations in the discrete adjoint on constrained shape optimization is investigated. The different approximations are compared with the exact discrete adjoint, which is capable of producing exact gradient/sensitivity information. The purpose of such a comparison is to understand whether or not approximate adjoint codes can be effective for shape optimization in spite of the ... [Show full abstract]
